This is the twelfth of an annual series of summary reports on major mines of Nevada. Sand and gravel operations are not included. Information on employment and production for the calendar year 2000 was provided by the individual mine operators. The Nevada Division of Minerals maintains a complete register of Nevada mines. For further information, contact them at 400 W. King, Suite 106, Carson City, Nevada 89703 or call (775) 684-7040, or visit their Web site at minerals.state.nv.us.

Voices of Youth program

17-year-old Shannon Squires of Elko, Nevada visited the Newmont Mine this past summer with camera and recorder in hand documenting life in the mining industry. Her work was part of the Voices of Youth program; an internship sponsored by the Western Folklife Center providing local students with training in professional photography and sound recording. Interns used their newly acquired skills to present a photographic exhibition and CD recording focusing on issues facing people in the rural west. To see and hear more about the Voices of Youth program, visit www.westernfolklife.org/voy. Shannon intends to major in photo journalism when she begins college.

Economic Impacts of Mining in Nevada—2000

The Nevada mineral industry led the nation in 2000 in the production of gold, silver, and barite as it has for several years. Nevada also produced a wide variety of other mineral and energy commodities such as aggregates, clays, copper, diatomite, dolomite, geothermal energy, gypsum, lapidary and gem stones, lime and limestone, lithium compounds, magnesium compounds, oil, perlite, salt, silica, and specialty aggregates and clays. The total value of Nevada’s mineral production in 2000 was about $2.7 billion (not including oil and geothermal energy). The production of precious metals accounted for about $2.5 billion.

Production Highlights
Nevada’s gold production was 8,585,000 troy ounces in 2000, the third year in a row above the 8 million ounce mark. This is higher than the 8,261,000 ounces produced in 1999, but short of 1998’s record level of 8,865,000 ounces. Nevada is the third largest producer of gold in the world, behind only South Africa and Australia. Underground operations contributed about 20% of the gold production in 2000. Silver production climbed to 23,205,000 troy ounces, up from 1999’s level of 19,470,000 ounces. The year 2000 was the sixth year out of the past seven that Nevada’s silver production has exceeded 20 million ounces. Nevada’s nickname, the “Silver State,” is still appropriate. Copper production was about 11.7 million pounds, down from the 61.8 million pounds produced in 1999. Gypsum production was about 2.1 million tons, down from the 2.6 million tons produced in 1999.

Employment
According to the Nevada Department of Employment, Training, and Rehabilitation, the Nevada mining industry employed approximately 11,050 employees for the last quarter of 1999 and the first three quarters of 2000, the latest yearlong period for which

![Production Chart]

employment figures are available. The average pay for mineral industry employees was $57,906 for this time period, the highest average of any employment sector in the state. In addition, it is estimated that there are over 36,000 jobs in the state relating to providing goods and services needed by the mining industry. Mining employment has dropped for the third year in a row due primarily to continued low commodity prices and a slowdown in the development of new precious metals mines.

**Taxes and Other Impacts**

The taxes paid by the mining industry to state and local government include property taxes, sales and use tax, and unique to the mining industry, net proceeds of mines tax. Based on information from the Nevada Department of Taxation, the property taxes paid by the mining industry in 1999 totaled $26.4 million. The amount of property taxes paid in the year 2000 is not known at this time. Sales and use taxes for fiscal year 2000 (July 1, 1999 to June 30, 2000) are calculated to be $10.4 million, based on $159.8 million in sales multiplied by an average rate of 6.5%. The preliminary amount of net proceeds of mines taxes due pending appeals in 2000 was $30.7 million.

**Permitting and Reclamation**

Before mining can take place, plans of operation must be submitted and permits must be obtained from federal and state agencies to ensure that other resources such as wildlife, air, and water are protected. Nevada and federal laws and regulations require that lands disturbed by mining activities must be rehabilitated so they can be used for other purposes once mining is completed. This process, called reclamation, returns mined areas to other productive uses such as livestock grazing, wildlife habitat, or new industrial applications. To ensure that reclamation is done, mine operators are required to post reclamation bonds that are held by government agencies. The bonds are released only after the mined area is stabilized and the reclamation goals have been met. Over $531 million in reclamation bonds are currently posted. Mine operators are proud of their efforts and are constantly seeking ways to enhance their reclamation technology.

**Gold Reserves**

Nevada’s reported gold reserves at or near currently operating mines that can be mined at a profit under current economic conditions
stood at about 73 million troy ounces at the end of 2000. The amount of reserves is always in a state of flux, with some reserves being lost to production, additional discoveries being made, and changing economic conditions. These reserves are down by about 14 million ounces from the 87 million ounces reported for the end of 1999. The price of gold and the cost of production are the main factors in determining whether a reserve is really a reserve or just a sub-economic resource. With the current price of gold between $260 and $270 per ounce, many companies have had to reevaluate their reserves and reclassify some as resources. Extensive gold resources, not currently economic, exist at or near many operations. An increase in the gold price would mean many companies would be able to reclassify their resources back into a reserve category. An increase in the cost of regulatory compliance has the same effect as a lowering of the gold price, thus increasingly complex and expensive regulations can reduce reserves. Under current conditions, the existing proven reserves are sufficient to sustain gold production at current levels for about 9 years.

**Exploration**

Exploration for new deposits, particularly gold, is an ongoing effort by both the producing companies and many others who do not operate mines in the state. Each year, the Division of Minerals conducts an exploration survey to determine the level of exploration activity and the factors that are responsible for those levels. The results for 2000 are not available yet, but the respondents to the 1999 survey indicated they spent $86.7 million on exploration in Nevada in 1999 and projected spending $102.0 million in 2000. The respondents reported having 225 geologists on their payrolls in 1999, but projected a decrease to 216 geologists in 2000. Existence of favorable geology was the most important factor influencing the level of the respondents activity, while commodity prices was the second most important factor. Exploration geologists and their support staff of drillers, assayers, and others represent a significant positive economic impact, particularly in Nevada’s rural areas.
Minerals Other Than Gold and Silver

Minerals besides gold and silver are also important to Nevada’s economy. Copper and industrial minerals such as barite, diatomite, dolomite, gypsum, limestone, lithium compounds, magnesite, perlite, salt, and specialty clays are produced in the state. Sand, gravel, and crushed stone are critical to the building requirements of the state’s infrastructure.

Oil and gas exploration and production is a relatively small industry when compared to mining, but is nonetheless important to the economy of east-central Nevada. In oil field terms, Nevada is considered a frontier, meaning its potential has yet to be realized. Oil production in 2000 was about 621,000 barrels (42 gallons per barrel) with an average value of $22.68 per barrel for a total calculated value of $14.1 million. Nevada oil is used for the production of kerosene, diesel, boiler fuel, and asphalt. No natural gas is commercially produced in the state although minor amounts of gas produced from some wells are used to fuel onsite equipment.

Nevada is rich in geothermal resources, and is second only to California in the production of geothermal power in the United States. Currently, Nevada has 14 plants at 10 locations that produced approximately 1.26 million megawatt hours of electricity. This is enough to power about 80,000 typical homes. Geothermal heat is also used for a variety of commercial, domestic, and public applications in Nevada. Mining and agriculture are among the beneficiaries of geothermal heat. Schools in Elko County, and homes and commercial buildings in Lincoln and Washoe Counties are examples of public and private facilities using this renewable energy source.

Conclusion

Nevada’s mineral industry continued to be a major economic force in the state during 2000. This situation should continue for many years to come. Challenges will exist, as they always have, but Nevada’s mineral reserves and the potential to add to them will spur the creativity of the mineral industry. During the past years of relatively low commodity prices, many producers have found ways to cut their production costs. They will be well positioned to take advantage of increased margins when commodity prices improve.
