This is the thirteenth of an annual series of summary reports on major mines of Nevada. Sand and gravel operations are not included. Information on employment and production for the calendar year 2001 was provided by the individual mine operators. The Nevada Division of Minerals maintains a complete register of Nevada mines. For further information, contact them at 400 W. King, Suite 106, Carson City, Nevada 89703 or call (775) 684-7040, fax (775) 684-7052, or visit their Web site at minerals.state.nv.us.

**Proprietary information.
The Nevada mineral industry led the nation in 2001 in the production of gold, silver, and barite as it has for several years. Nevada also produced a wide variety of other mineral and energy commodities such as aggregates, copper, diatomite, dolomite, geothermal energy, gypsum, lapidary and gem stones, lime and limestone, lithium compounds, magnesium compounds, oil, perlite, salt, silica, and specialty aggregates and clays. The total value of Nevada’s mineral production in 2001 was about $2.8 billion (not including oil and geothermal energy). The production of precious metals accounted for about $2.4 billion.

Production Highlights
Nevada’s gold production was 8,125,440 troy ounces in 2001, the fourth year in a row above the 8 million ounce mark. This is lower than the 8,585,000 ounces produced in 2000, but still enough to make Nevada the third largest producer of gold in the world, behind only South Africa and Australia. Underground operations contributed about 20% of the gold production in 2001, approximately the same as 2000. Silver production dropped to 17,452,000 troy ounces, compared to the 2000 production level of 23,189,000 ounces. Nevada’s nickname of the “Silver State” is still appropriate. Copper production was about 7.1 million pounds, down from the 11.7 million pounds produced in 2000. Gypsum production was about 2.2 million tons, up from the 2.1 million tons produced in 2000.

Employment
According to the Nevada Department of Employment, Training, and Rehabilitation, the Nevada mining industry employed 10,271 employees for the last quarter of 2000 and the first three quarters of 2001, the latest year long period for which employment figures are available. The average pay for mineral industry employees was $58,320 for this time period, the
highest average of any employment sector in the state. In addition, it is estimated that there are over 37,000 jobs in the state relating to providing goods and services needed by the mining industry. Mining employment dropped for the third year in a row due primarily to continued low commodity prices and a slowdown in the development of new precious metals mines.

**Taxes and Other Impacts**

The taxes paid by the mining industry to state and local government include property taxes, sales and use tax, and unique to the mining industry, net proceeds of minerals tax. Based on information from the Nevada Department of Taxation, the property taxes paid by the mining industry in 2000 totaled $25.3 million. Sales and use taxes for 2000 were $39.8 million. The amount of net proceeds of minerals taxes in 2000 was $29.6 million with $14.1 million going to the counties and $15.5 million going to the state.

**Permitting and Reclamation**

Before mining can take place, plans of operation must be submitted and permits must be obtained from federal and state agencies to ensure that other resources such as wildlife, air, and water are protected. Nevada and federal laws and regulations require that lands disturbed by mining activities must be rehabilitated so they can be used for other purposes once mining is completed. This process, called reclamation, returns mined areas to other productive uses such as livestock grazing, wildlife habitat, or new industrial applications. To ensure that reclamation is done, mine operators are required to post reclamation bonds that are held by government agencies. The bonds are released only after the mined area is stabilized and the reclamation goals have been met. According to the Nevada Division of Environmental Protection, approximately $548 million in reclamation bonds are currently posted. Mine operators are proud of their efforts and are constantly seeking ways to enhance their reclamation technology.

**Gold Reserves**

Nevada’s reported gold reserves at or near currently operating mines that can be mined at a profit under current economic conditions stood at about 67 million troy ounces at the end of 2001. The amount of
Reserves is always in a state of flux, due to some reserves being lost to production, additions to reserves through new discoveries, and changing economic conditions. Notwithstanding over 8 million ounces produced in 2001, statewide reserves are down by only 6 million ounces from the 73 million ounces reported for the end of 2000. The price of gold and the cost of production are the main factors in determining whether a reserve is really a reserve or just a sub-economic resource. Extensive gold resources, not currently economic, exist at or near many operations. An increase in the gold price would mean many companies would be able to reclassify their resources back into reserve category. An increase in the cost of regulatory compliance has the same effect as a lowering of the gold price, thus increasingly complex and expensive regulations can reduce reserves. Under current conditions, the existing proven reserves are sufficient to sustain gold production at current levels for over 8 years.

Exploration
Exploration for new deposits, particularly gold, is an ongoing effort by both the producing companies and many others who do not operate mines in the state. Each year, the Division of Minerals conducts an exploration survey to determine the level of exploration activity and the factors that are responsible for those levels. The results for 2001 are not available at this time, but the respondents to the 2000 survey indicated they spent $76.9 million on exploration in Nevada in 2000 and projected spending $59.4 million in 2001. The respondents reported having 125 geologists on their payrolls in 2000, and projected a decrease to 91 geologists in 2001. Existence of favorable geology was the most important factor influencing the level of the respondents activity, while commodity prices was the second most important factor. Exploration geologists and the drillers, assayers, and others who support their activities, represent a significant positive economic impact, particularly in Nevada's rural areas.
Minerals Other Than Gold and Silver

Minerals besides gold and silver are also important to Nevada’s economy. Copper and industrial minerals such as barite, diatomite, dolomite, gypsum, limestone, lithium compounds, magnesite, perlite, salt, and specialty clays are produced in the state. Sand, gravel, and crushed stone are critical to the building requirements of the state’s infrastructure.

Oil and gas exploration and production is a relatively small industry when compared to mining, but is nonetheless important to the economy of east-central Nevada. In oil field terms, Nevada is considered a frontier, meaning its potential has yet to be realized. Oil production in 2001 was about 571,000 barrels (42 gallons per barrel) with an average value of $17.13 per barrel for a total calculated value of $9.78 million. This compares with an oil production of about 621,000 barrels in 2000. According to the Minerals Management Service Mineral Revenues 2000, Nevada received $2,667,160 in FY2000 for oil royalties, other royalties, rents, bonuses, and other revenues from Federal mineral leases. Nevada oil is used for the production of kerosene, diesel, boiler fuel, and asphalt. No natural gas is commercially produced in the state although minor amounts of gas produced from some wells are used to fuel onsite equipment.

Nevada is rich in geothermal resources, and is second only to California in the production of geothermal power. Currently, Nevada has 14 plants at 10 locations that sold approximately 1.3 million megawatt hours of electricity in 2001. This is enough to power about 80,000 typical homes. Geothermal heat is also used for a variety of commercial, domestic, and public applications in Nevada. Mining and agriculture are among the beneficiaries of geothermal heat. Schools in Elko County, and homes and commercial buildings in Lincoln and Washoe Counties are examples of public and private facilities using this renewable energy source.

Conclusion

Nevada’s mineral industry continued to be a major economic force in the state during 2001. This situation should continue for many years to come. Challenges will exist, as they always have, but Nevada’s mineral reserves and the potential to add to them will spur the creativity of the mineral industry. During the past years of relatively low commodity prices and increasing energy costs, many producers have found ways to cut their production costs. Many companies have merged in recent years in an effort to lower overhead costs and increase synergies. They will be well positioned to take advantage of increased margins when commodity prices improve.
