This is the sixteenth of an annual series of summary reports on major mines of Nevada. Sand and gravel operations are not included. Information on employment and production for the calendar year 2004 was provided by the individual mine operators. The Nevada Division of Minerals maintains a complete register of Nevada mines. For further information, contact them at 400 W. King, Suite 106, Carson City, Nevada 89703 or call (775) 684-7040, fax (775) 684-7052, or visit their Web site at http://minerals.state.nv.us.

The Nevada mineral industry led the nation in 2004 in the production of gold and barite as it has for several years. In 2004, Alaska became our nation’s leading silver producer, a title Nevada had held for many years. Nevada also became the leading gypsum producing state. Nevada’s mines produced a wide variety of other mineral and energy commodities such as aggregates, copper, diatomite, dolomite, geothermal energy, lapidary and gem stones, lime and limestone, lithium compounds, magnesium compounds, oil, perlite, potassium sulfate, salt, silica sand, and specialty aggregates and clays. The total value of Nevada’s mineral production in 2004 was about $3.3 billion (not counting oil and geothermal energy). The production of precious metals accounted for about $3.0 billion.

Production Highlights

Nevada’s gold production was 6,942,000 troy ounces in 2004. This is less than the 7,318,000 ounces produced in 2003, but still enough to make Nevada the third largest producer of gold in the world behind only South Africa and Australia. Underground operations contributed about 22% of the gold production in 2004. Silver production rose to 10,398,000 troy ounces, compared to 10,246,000 ounces in 2003. Barite production was 559,000 tons, copper production was 26.9 million pounds, and gypsum production was 2,310,000 tons, all up from their 2003 levels.

Employment

According to the Nevada Department of Employment, Training, and Rehabilitation, the Nevada mining industry employed an average of 9,559 employees in 2004. The average pay for mineral industry employees during this time was $63,387 per year, the highest average of any employment sector in the state. In addition, it is estimated that there are about 48,000 jobs in the state relating to providing goods and services needed by the mining industry. Mining employment was up after declining for the past five years. This is due to more
favorable prices for mineral commodities resulting in expansions at some operations and the opening of others.

**Taxes and Other Impacts**

The taxes paid by the mining industry to state and local government include property taxes, sales and use tax, and unique to the mining industry, net proceeds of minerals tax. Based on information from the Nevada Department of Taxation, the amount of net proceeds of minerals tax billed for 2004 was $44.0 million, with $23.2 million earmarked for the counties and $20.8 million earmarked for the state.

**Permitting and Reclamation**

Before mining can take place, plans of operation must be submitted and permits must be obtained from federal and state agencies to ensure that resources such as wildlife, air, and water are protected. Nevada and federal laws and regulations require that lands disturbed by mining activities must be rehabilitated so they can be used for other activities once mining is completed. This process, called reclamation, returns mined areas to other productive uses such as livestock grazing, wildlife habitat, or new industrial applications. To ensure that reclamation is done, mine operators are required to post reclamation bonds that are held by government agencies. The bonds are released only after the mined area is stabilized and the reclamation goals have been met. According to the Nevada Division of Environmental Protection, approximately $724 million in reclamation bonds are currently posted. Mine operators are proud of their efforts and are constantly seeking ways to enhance their reclamation technology.

**Gold Reserves**

Nevada’s reported gold reserves at or near currently operating mines that can be mined at a profit under current economic conditions stood at about 80.3 million troy ounces at the end of 2004. The amount of reserves is always in a state of flux, due to some reserves being lost to production, additions to reserves through new discoveries, and changing economic conditions. Even though 6.9 million ounces of gold were produced in 2004, statewide reserves are up by 14 million ounces from the 66 million ounces reported for the end of 2003. The price of gold and the cost of production are the main factors
determining whether a reserve is really a reserve or just a sub-economic resource. Extensive gold resources, not currently economic, exist at or near many operations. An increase in the gold price would mean many companies would be able to reclassify their resources back into a reserve category. An increase in the cost of regulatory compliance has the same effect as a lowering of the gold price, thus increasingly complex and expensive regulations can reduce reserves. Under current conditions, the existing proven reserves are sufficient to sustain gold production at current levels for over 11 years.

**Exploration**

Exploration for new deposits, particularly gold, is an ongoing effort by both the operating companies and many others who do not operate mines in the state. Each year, the Division of Minerals conducts an exploration survey to determine the level of exploration activity and the factors that are responsible for those levels. The respondents to the latest survey indicated they spent $79.7 million on exploration in Nevada in 2004 and projected spending $111.9 million in 2005. The respondents reported having 124 geologists on the payroll in 2004 and projected an increase to 145 in 2005. Exploration geologists and the drillers, assayers, and others who support their activities represent a significant positive economic impact, particularly in Nevada’s rural areas.

**Minerals Other Than Gold and Silver**

Minerals other than gold and silver are also important to Nevada’s economy. Sand, gravel, and crushed stone are critical to the building requirements of the state’s infrastructure and are second only to gold in terms of dollar value. Copper and industrial minerals such as barite, diatomite, dolomite, gypsum, limestone, lithium compounds, magnesite, perlite, salt, and specialty clays are produced in this state.

Oil and gas exploration and production are relatively minor when compared to mining, but are nonetheless important to the economy of east-central Nevada. In oil field terms, Nevada is considered a frontier, meaning its potential is yet to be realized. Oil production in 2004 was about 463,000 barrels (42 gallons per...
barrel). According to the Nevada Department of Taxation, the actual gross proceeds for oil in 2004 were $14.8 million, thus the average calculated value for Nevada was $31.98 per barrel.

Nevada is rich in geothermal resources and is second only to California in the production of geothermal power. Currently, Nevada has 14 plants at 10 locations that sold approximately 1.3 million megawatt hours of electricity in 2004. This is enough to power about 80,000 typical homes. Geothermal heat is also used for a variety of commercial, domestic, and public applications in Nevada. Mining and aquaculture are among the beneficiaries of geothermal heat. Schools in Elko County and homes in Lincoln and Washoe Counties are examples of public and private facilities using this renewable energy source.

**Conclusion**

Nevada’s mineral industry continued to be a major economic force in the state in 2004. This situation should continue for many years to come. Challenges will exist, as they always have, but Nevada’s mineral reserves and the potential to add to them will spur the creativity of the mineral industry. Prices of many mineral commodities have improved in recent years, allowing companies to increase their exploration and development efforts. The continued development of new projects will assure that the mining industry will remain strong in the future.
